Passwordless Access for Desktops

Secret Double Octopus enables passwordless workstation logon using its Octopus Credential Provider. To access their workstations, Windows or Mac users simply enter their username in the Octopus Credential Provider running on their workstation. The Credential Provider communicates with the Octopus Authentication Server, which looks up the user and sends a secure push notification to the Octopus Authenticator app on the user's registered device. The user in turn authenticates to the Octopus Authenticator app and approves the authentication request. The Octopus Authentication Server then communicates with the Domain Controller to complete the logon process.

To enable users to logon to their workstations even when offline, the Octopus Authenticator communicates with the Octopus Credential Provider directly over a local BLE connection.
